More about our Managed Features program...

It is well documented that the strategy of "selling premium" (short options) is profitable in "quiet" or low volatility markets. However, when volatility increases sharply, many months (or even years!) of profit can be lost if risk is not properly managed. **The Balanced Volatility Program ("BVP") was developed as an alternative to "naked" option selling programs.** A primary objective of the program is to offset volatility risks which are inherent in short option or "premium selling" programs, while still offering the benefits of an absolute return strategy.

Trading in futures and options is speculative and not suitable for all investors. Substantial losses can be incurred. Before investing in the BVP, one must review the most recent Disclosure Document of Crescent Bay Capital Management which contains a more thorough description of trading method and strategy.

VAMI reflects the growth of a hypothetical \$1,000 in a given investment over time. The value is equal to \$1,000 at inception. Subsequent month-end values are calculated by multiplying the previous month's VAMI index by 1 plus the current month rate of return. PAST PERFORMANCE IS NOT INDICATIVE OF FUTURE RESULTS
